

Abstract of the Disclosure:

If a PC card is inserted into a card slot for the PC card, both of button portions are pressed by the PC card. When the both of the button portions are pressed outwardly in the Z-direction, both of engagement portions are released from engagement recesses, respectively, so that a stopper is allowed to move in a space to permit the PC card to be inserted into the card slot. Otherwise, the stopper is still locked at a position shown in the drawing, by at least one of the engagement portions to prevent an erroneous card having a thickness smaller than the PC card from being inserted into the card slot.
